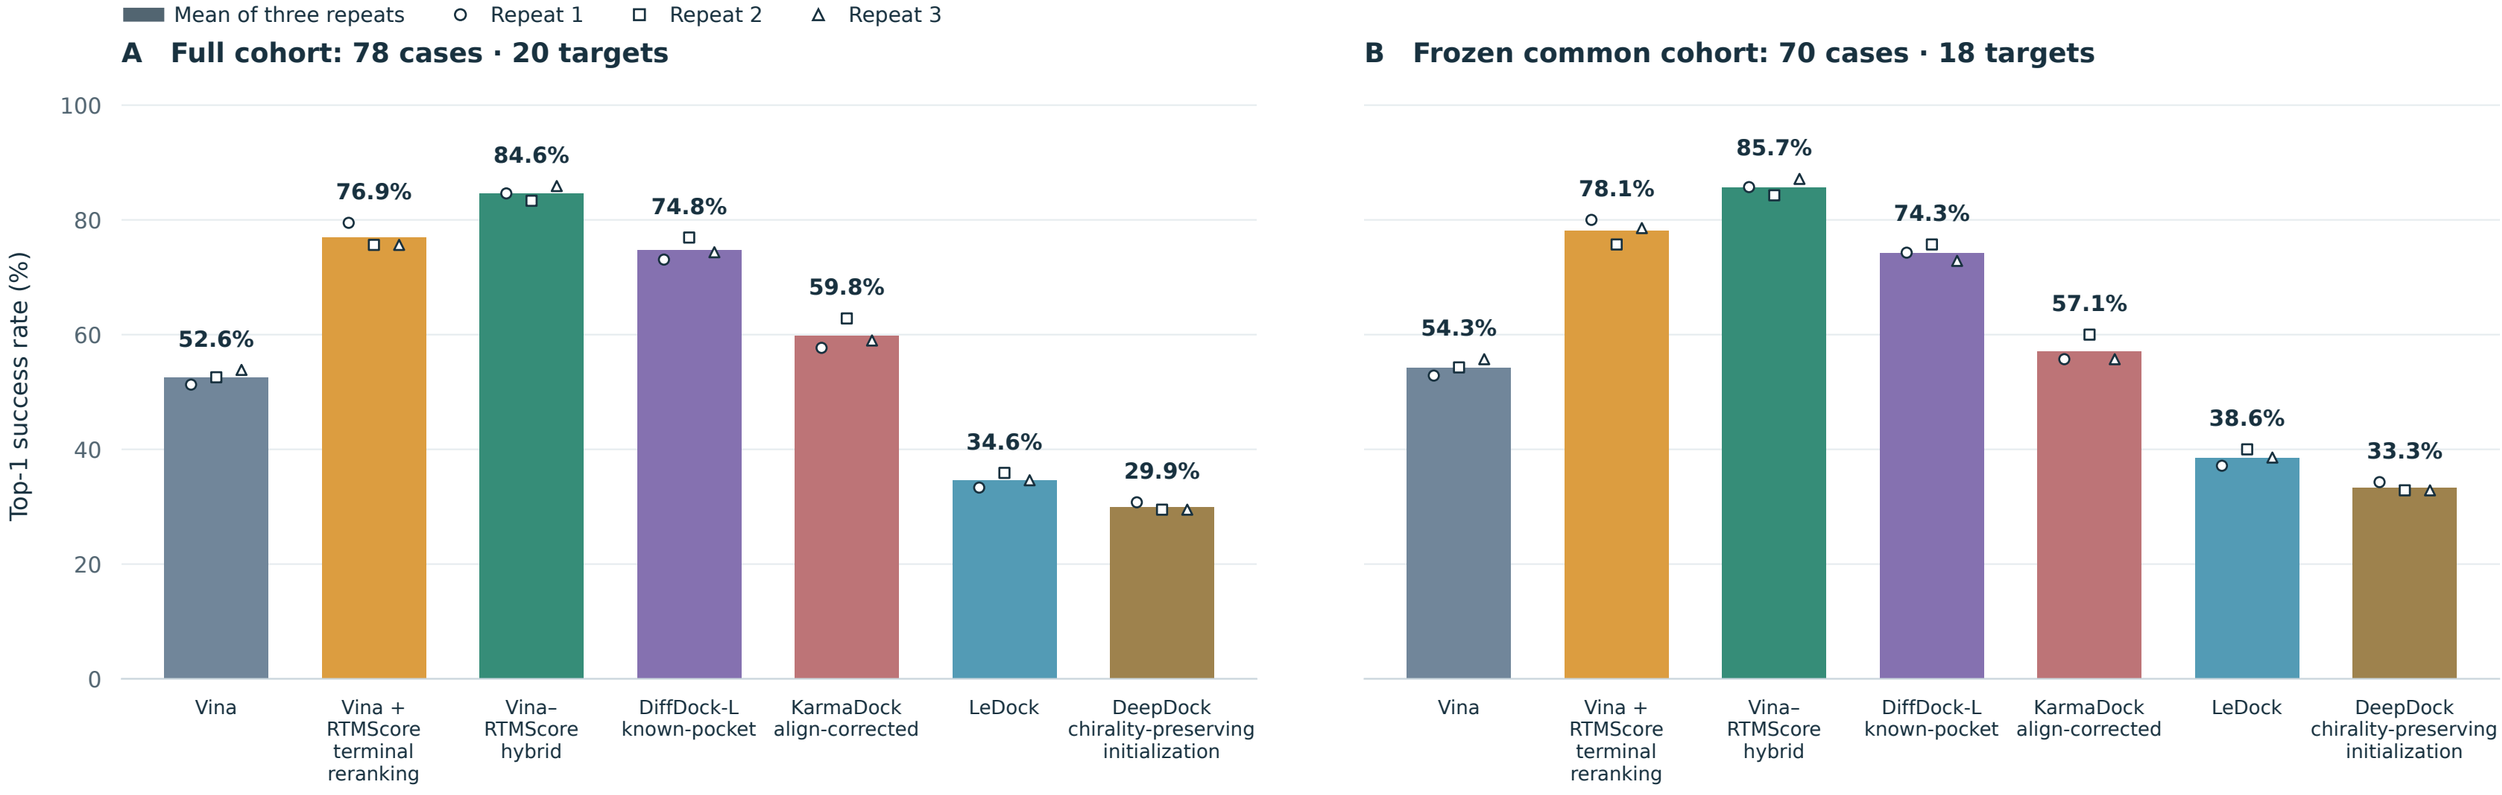
# Top-1 pose recovery across seven docking methods

Known binding site · Receptor-fixed coordinates · Symmetry-aware heavy-atom RMSD ≤ 2 Å



Bars: case-weighted mean of three repeats; markers: individual repeats. Failures remain in each cohort denominator.

Common cohort: receptor-preparation support frozen before new RMSD evaluation; run failures still count as unsuccessful.

No ligand fitting. Computational budgets are unmatched. LeDock repeats are separate process trials without controlled engine seeds.

Cases share targets; repeat points are descriptive, not confidence intervals or independent samples. Training overlap varies by method.
